

Gil,

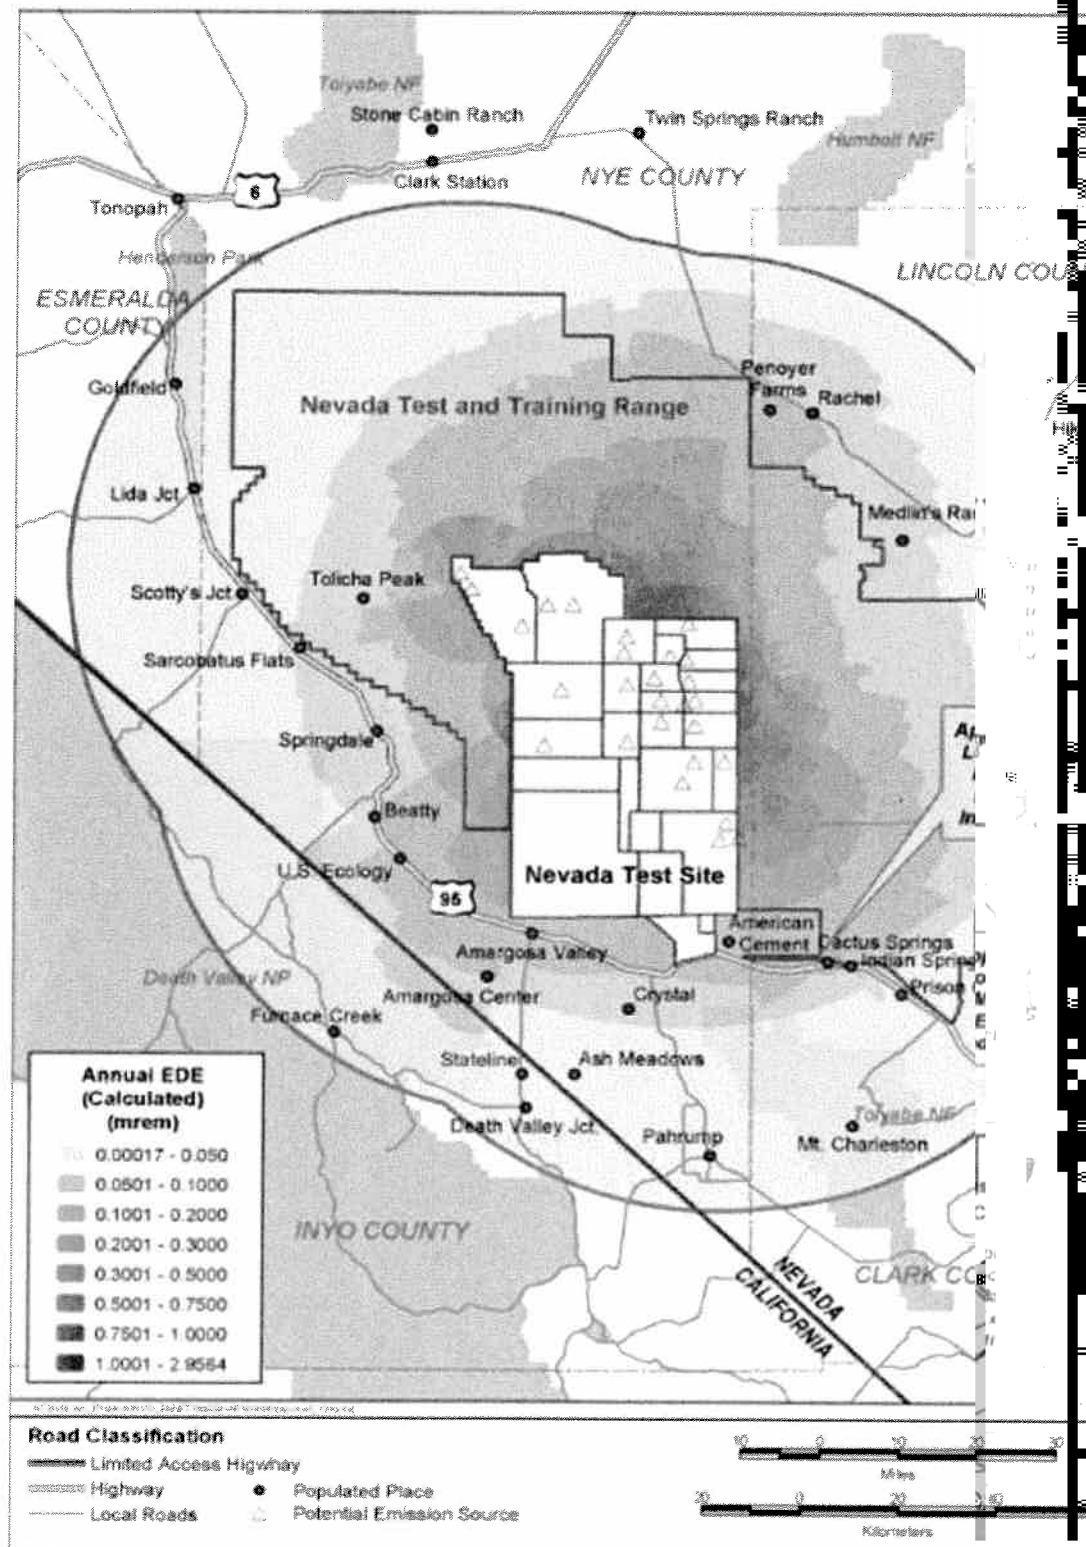

For our population estimates, we've consistently used the communities that fell within 50 miles of the Control P. However, for dose calculations, we've always made calculations out to 50 mi from each of our release locations. are listed in the attached spread sheet. Though our population was based on this, we displayed the individual d each release point in the 2003 (see figure 2 below) and 2004 NESHAP reports. As I mentioned, the most current distance from the boundaries (figure 3) -for post-2004. So, if you want to be consistent with the past (pre-2005 would think a point center to the release points would be better but not sure at this time how different that wo

Hope this helps.
